Claims 1-5, 9-17, 19, 23, 25-30, 32, 34-39 and 41-46 rejected under 35 U.S.C. 103(a) as being unpatentable over Mahvi et al. (2002/0022864). Mahvi et al. disclose a medical probe assembly (figure 1) for ablating tissue, comprising: an elongated member having a distal end; two electrode (22 a & b) elements mechanically coupled to the distal end of the elongated member. Mahvi et al. is silent as to another electrode element mechanically coupled to the distal end of the elongated member between the respective two electrode elements, the two electrode elements and other electrode element being configurable as two bipolar electrode pairs, wherein the other electrode element is common to the bipolar electrode pairs; wherein at least one of the two electrode elements and other electrode element is an array comprising a plurality of electrodes radially extendable from the elongated member. To have provided the Mahvi et al. device with another electrode element would have been obvious to one of ordinary skill in the art at the time the invention was made since it has been held that a mere duplication of essential working parts involve only routine skill in the art.
